Version Control

merekam setiap perubahan berkas

mengembalikan perubahan berkas sebelumnya

membandingkan perubahan setiap saat

Mengapa Version Control ?

Bring Order to chaos

tidak untuk Version Control

Kolaborasi

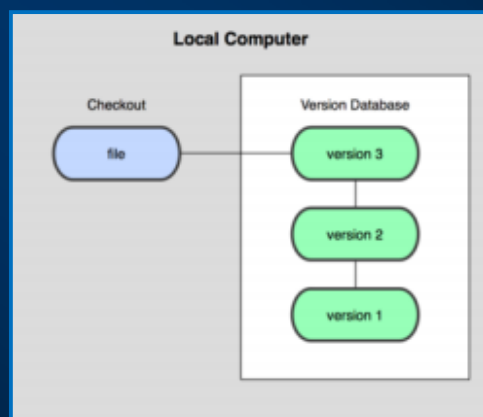

Type Version Control System

Local Version Control System

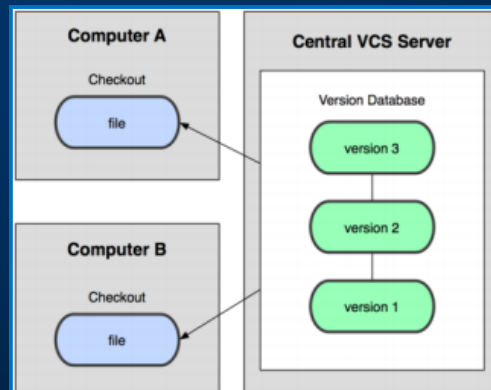

Centralized Version Control System

Distributed Version Control System

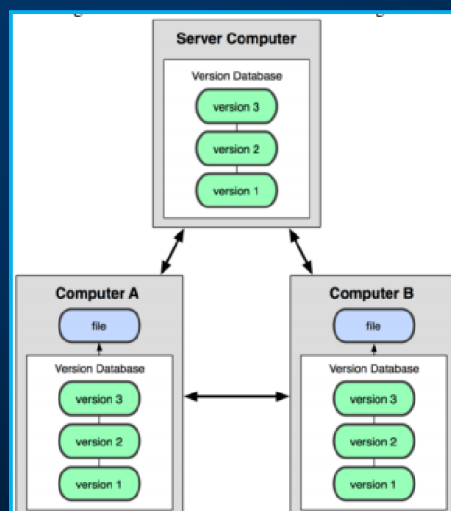

Local Version Control System

Centralized Version Control System

Distributed Version Control System

Software Version Control

Subversion

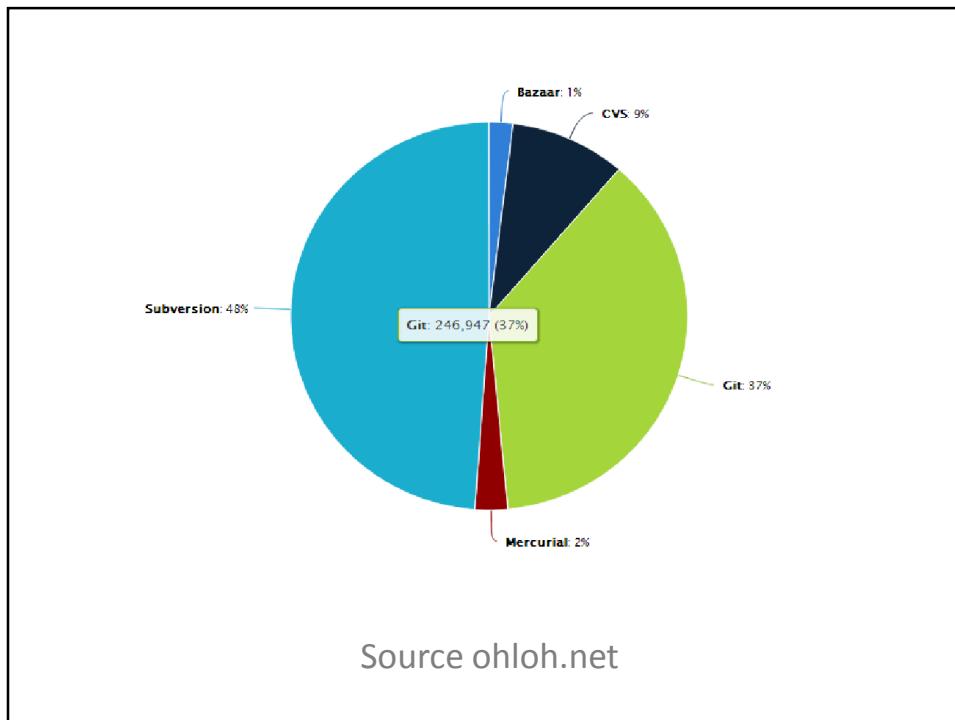

Bazar

CVS

Mercurial

Git

Mengapa menggunakan Git ?

Proyek yang menggunakan Git

Jquery

Linux Kernel

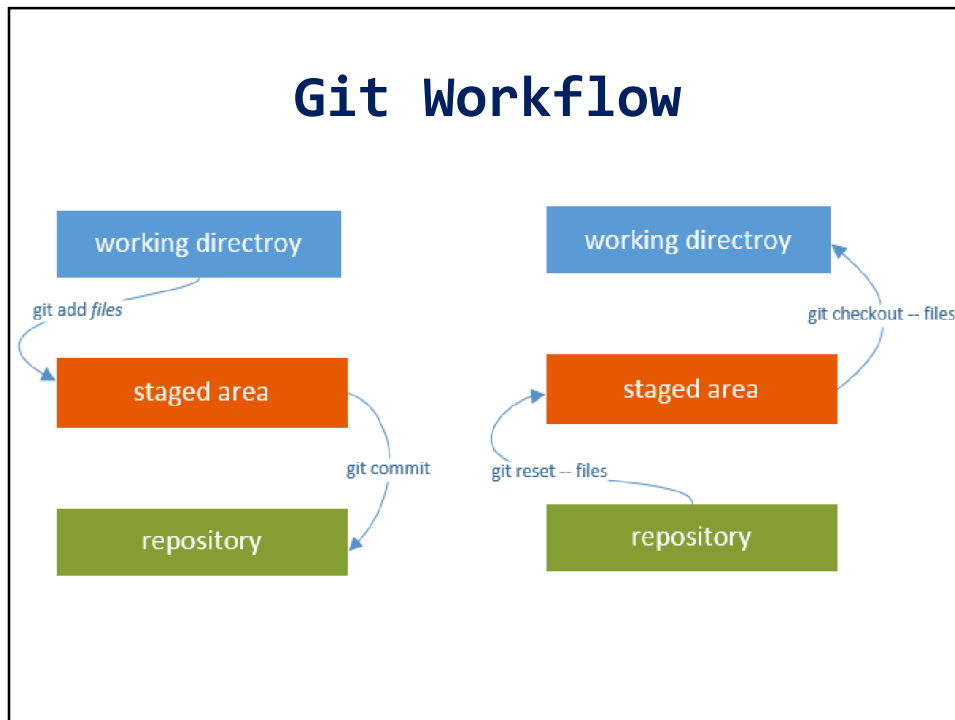

Ruby on rails

Android

PostgreSQL

OpenStack

Source : <https://github.com/blog/1359-the-octoverse-in-2012>

Tiga point penting workshop

Setup dan konfigurasi dasar Git

Perintah Dasar

Setup GitHub dan Kolaborasi

Git Setup

Download Git for Windows

Download Git for Linux

Modul Setup Git

Setup Git for Windows

Setup Git For Linux

Konfigurasi Git Global

Membuat file .gitconfig

```
$ touch .gitconfig
```

Atau

```
$ git config
```

Mengkonfigurasi git Global dengan perintah :

```
$ git config --global user.name "Nama Lengkap"
```

```
$ git config --global user.email "user@email.com"
```

Konfigurasi Git Global

Memeriksa hasil Konfigurasi :

```
$ cat ~/.gitconfig
```

Hasil perintah :

```
[user]
name = Saiful Mukharom
email = ritnesaif@gmail.com
```

Konfigurasi Git Local

Membuat direktori baru dengan perintah :

```
$ mkdir public_repo  
$ cd public_repo/
```

Membuat working direktori

```
$ mkdir my_project  
$ cd my_project  
$ git init
```

Konfigurasi Git Local

Mengkonfigurasi Git local :

```
$ git config user.name "Nama Lengkap"  
$ git config user.email "user@email.com"
```

Memeriksa hasil konfigurasi :

```
$ cat .git/config
```

```
[user]  
name = Saiful Mukharom  
email = ritnesaif@gmail.com
```

Perbedaan

Global :
`~/.gitconfig`

Local
`~/public_repo/my_project/.git/config`

Perintah Mendasar

- mkdir
- cd
- touch
- cat
- cp
- mv
- rm
- vi
- config
- init
- add
- commit
- clone
- remote
- pull
- push

Perintah Dasar Git

Membuat Working Directory :

```
$ git init
```

```
entirsaif@SAIFULINDO ~/public_repo/my_project (master)
$ git init
Initialized empty Git repository in c:/Users/entirsaif/public_repo/my_project/.git/
entirsaif@SAIFULINDO ~/public_repo/my_project (master)
$
```

Menampilkan Informasi Repository :

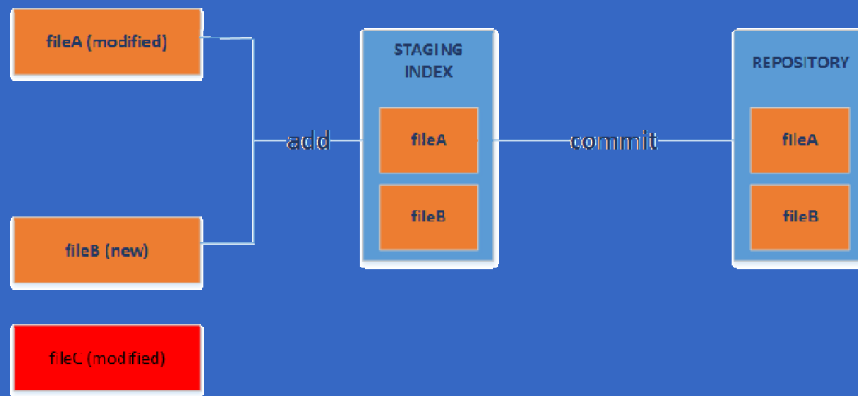

```
$ git status
```

```
entirsaif@SAIFULINDO ~/public_repos (master)
$ git status
On branch master

Initial commit

nothing to commit (create/copy files and use "git add" to track)
```

add dan commit

Buat File Baru :

```
$ touch fileA.txt
```

Menambahkan ke staging index :

```
$ git add fileA.txt
```

Menampilkan informasi fileA.txt

```
$ git status
```

```
entirsaif@SAIFULINDO ~/public_repos/gitbook (master)
$ git status
On branch master

Initial commit

Changes to be committed:
  (use "git rm --cached <file>..." to unstage)

   new file:   fileA.txt
```

Untuk commit perubahan :

```
$ git commit -m "initial commit"
```

Sekarang File di commit ke HEAD
(database repositori)

```
entirsaif@SAIFULINDO ~/public_repos/gitbook (master)
$ git commit -m "initial commit"
[master (root-commit) 0a15d19] initial commit
1 file changed, 0 insertions(+), 0 deletions(-)
create mode 100644 fileA.txt
```

```
entirsaif@SAIFULINDO ~/public_repos/gitbook (master)
$ git status
On branch master
nothing to commit, working directory clean
```

Edit fileA.txt :

```
$ echo "hello file A" > fileA.txt
```

Tambahkan ke staging index dahulu :

```
$ git add fileA.txt
```

```
The file will have its original line endings in your working directory.
On branch master
Changes to be committed:
  (use "git reset HEAD <file>..." to unstage)

    modified:   fileA.txt
```

Tambahkan fileA.txt ke repositori :

```
$ git commit -m "update file A"
```

Log

Menampilkan log yang sudah di commit :

```
$ git log
```

Menampilkan log dengan format ringkas :

```
$ git log --oneline
```

Untuk melihat commit log secara GUI:

```
$ gitk
```

Kolaborasi

Team Work

Maksimal empat anggota

Kolaborasi GitHub

Registrasi Akun Pribadi di
<https://github.com>

Build software better, together.

Powerful collaboration, code review, and code management for open source and private projects. Need private repositories? [Upgraded plans start at \\$7/mo.](#)

Pick a username

Your email

Create a password

Use at least one lowercase letter, one numeral, and seven characters.

Sign up for GitHub

By clicking "Sign up for GitHub", you agree to our [terms of service](#) and [privacy policy](#). We will send you account related emails occasionally.

Generarating SSH-Keygen

Buat ssh-keygen baru :

```
$ ssh-keygen -t rsa -C "alamat_email/nama_host"
```

Tempat Genereting ssh-keygen

```
/user/<username>/.ssh/
```

```
$ ls ~/.ssh
```

```
entirsaiif@SAIFULINDO ~
$ ls ~/.ssh/
id_rsa id_rsa.pub known_hosts known_hosts.bak
```

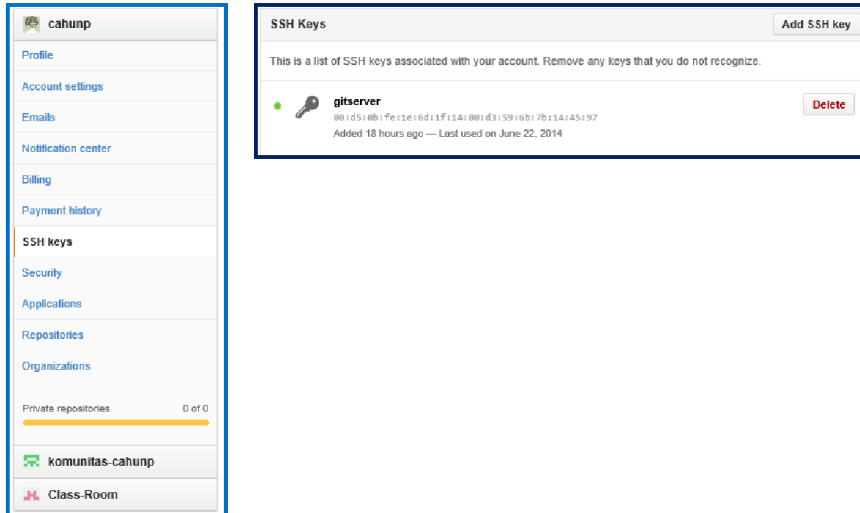

Account Setting

Copy id_rsa.pub

```
$ clip < ~/.ssh/id_rsa.pub  
# Copies the contents of the id_rsa.pub file to your clipboard
```

Add SSH key

The screenshot shows the GitHub user interface for managing SSH keys. On the left is a navigation sidebar for user 'cahup' with options like Profile, Account settings, Emails, Notification center, Billing, Payment history, SSH keys (highlighted), Security, Applications, Repositories, and Organizations. Below these are 'Private repositories' (0 of 0) and organization links for 'komunitas-cahup' and 'Class-Room'. The main content area is titled 'SSH Keys' and contains a list of keys. One key named 'gitserver' is shown with its fingerprint and a 'Delete' button. An 'Add SSH key' button is in the top right corner.

verifikasi

```
$ ssh -T git@github.com
# Attempts to ssh to github
```

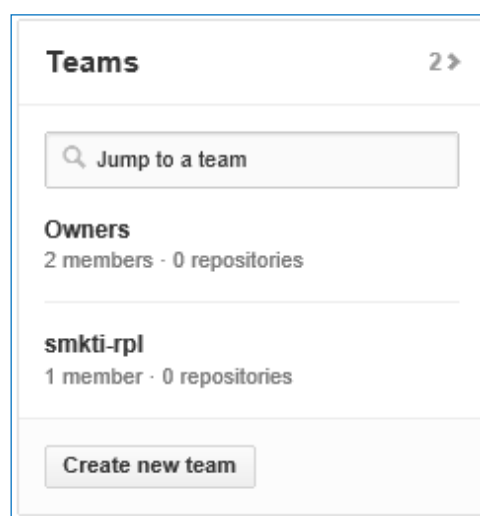

```
The authenticity of host 'github.com (207.97.227.239)' can't be established.
RSA key fingerprint is 16:27:ac:a5:76:28:2d:36:63:1b:56:4d:eb:df:a6:48.
Are you sure you want to continue connecting (yes/no)?
```

```
Hi username! You've successfully authenticated, but GitHub does not
provide shell access.
```

README.md

```
413 lines (309 sloc) | 18.738 kb  Raw Blame History
1      Linux kernel release 3.x <http://kernel.org/>
2
3      These are the release notes for Linux version 3.  Read them carefully,
4      as they tell you what this is all about, explain how to install the
5      kernel, and what to do if something goes wrong.
6
7      WHAT IS LINUX?
8
9      Linux is a clone of the operating system Unix, written from scratch by
10     Linus Torvalds with assistance from a loosely-knit team of hackers across
11     the Net.  It aims towards POSIX and Single UNIX Specification compliance.
12
13     It has all the features you would expect in a modern fully-fledged Unix,
14     including true multitasking, virtual memory, shared libraries, demand
15     loading, shared copy-on-write executables, proper memory management,
16     and multistack networking including IPv4 and IPv6.
